Because the individual sections will be used on varying sub-pages: Please make all headings in H1 and H2 (CSS) the same.
We edit the contents via a WYSIWYG editor. Therefore, please do not use nested classes or empty HTML tags. This also applies to all texts and titles on the complete layout.

This is an extension of the website and it is important that your changes fit into the existing image and CSS data. **So please also pull any changes we made via GIT before your development.**

Logo and Menu: You don't have to adapt that. It can stay as it is in the original files. We will adjust the colour later.
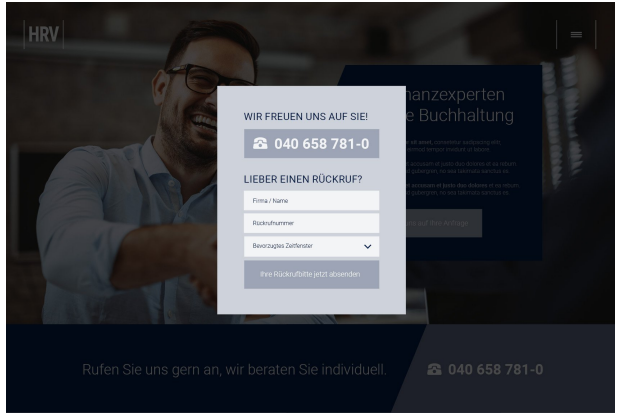

Section: Image with Text (class="img-w-text") A large image in the background. A field with a title, text, bullet points and a button. The button should call up a lightbox (next image at the bottom of this page).

The element already exists in the version you have realised and you don't have to realise it again.

Section: Text with image 3 (class="text-with-image-3") On the left is a text with title, subtitle, text and on the right an image and below a text and a telephone number (linked).

Section: Text with image 4 (class="text-with-image-4") On the left is a text with title, subtitle, text and a button. Below a text and a telephone number. On the right an image. The button should call up a lightbox (next image at the bottom of this page).

The element already exists in the version you have realised and you don't have to realise it again.

This is what the lightbox should look like. Please use Fancybox.

Some text at the top, a telephone number and a form with three fields. The dropdown should contain the following elements:

Bevorzugtes Zeitfenster
So bald wie möglich!
Vormittags (09 - 12h)
Nachmittags (13 - 17h)

Project requirements:

1. valid html5 (please use https://validator.w3.org/ to check)
2. **Please use Bootstrap with all its possibilities.** For additional changes, please use your own classes. For example: Please use the bootstrap class .btn for buttons. Please overwrite/modify further adjustments to the buttons with an additional class and not with .btn.
3. The page has to be responsive.
4. Please use SCSS.
5. Again we will need a html structure like
```
<header>...</header>
<section>
        <div class="slideshow">(...)</div>
</section>
<section>...</section>
<section>...</section>
<section>
        <div class="map">(...)</div>
</section>
<footer></footer>
```
Please use the class names for the inner div elements as stated above. We would like to work with them.
5. Please use h1 - h4 for the titles and subtitles (some may already be marked in the layout). In general, appropriate HTML elements should always be used. For example, <address> instead of <div class="address">.
6. Please do not add classes to elements, if they are not necessary. For example, an ul can be referenced via CSS and a class does not necessarily have to exist if some parent element already has a distinct one. Bootstrap classes should always be used if applicable.
7. Try not to nest classes. Use as few classes as possible, as we want to use this in a cms and we get problems with classes in a wysiwyg editor.
8. Please use nth-child selector with caution. Use it, for example, to provide every second element with a background. But please not to style the nth div in a large set of divs. In such cases, please rather add a class.
9. Please do not use <span> or <div> without a class. It might then be automatically removed by our wysiwyg editor. Other elements like <em> are often better. If it must be a span or div, then please add a class.
10. Please use the HD Version for all small icon like the phone-icon or arrows in the slideshow so that they are not blurry. Even better if you can use font-awesome if possible. We always prefer font-awesome!
11. Please use the 72dpi version because of the sizes. We have added the original 144dpi version because sometimes there are errors in the colors and in fine lines after resizing from 144dpi to 72dpi. So if something is unclear you can look there. But always use the 72dpi version as base.
12. Please use a sprite file in which all icons can be found in one image file, which is then loaded only once.
13. Elements where it says "We already had the element above" must be in the HTML structure and classes exactly like the element above. If this is not possible please send a message.
14. Always download and embed (Google) Fonts, as it is not allowed to link to the google fonts as of privacy regulations in Germany. Please also do not include any files from third party servers. As this is not allowed as of privacy regulations in Germany. Always embed it locally.
15. Standard text formats like <strong>, <i>, <em> but also <ul>, <ol> and <li> should work in all elements with longer texts. For example, in all two-column elements as well as in content elements.
